- For all questions, show your work!
- Use a document preparation system such as LaTeX.
- Submit your answers electronically via Gradescope.

**Question 1.** Using the following definition of the derivative and the definition of the Heaviside step function:

$$\frac{d}{dx}f(x) = \lim_{\epsilon \to 0} \frac{f(x+\epsilon) - f(x)}{\epsilon} \qquad H(x) = \begin{cases} 1 & \text{if } x > 0\\ \frac{1}{2} & \text{if } x = 0\\ 0 & \text{if } x < 0 \end{cases}$$

- 1. Show that the derivative of the rectified linear unit  $g(x) = \max\{0, x\}$ , wherever it exists, is equal to the Heaviside step function.
- 2. Give two alternative definitions of g(x) using H(x).
- 3. Show that H(x) can be well approximated by the sigmoid function  $\sigma(x) = \frac{1}{1 + e^{-kx}}$  asymptotically (i.e for large k), where k is a parameter.
- \*4. Although the Heaviside step function is not differentiable, we can define its **distributional derivative**. For a function F, consider the functional  $F[\phi] = \int_{\mathbb{R}} F(x)\phi(x)dx$ , where  $\phi$  is a smooth function (infinitely differentiable) with compact support  $(\phi(x) = 0$  whenever  $|x| \ge A$ , for some A > 0).

Show that whenever F is differentiable,  $F'[\phi] = -\int_{\mathbb{R}} F(x)\phi'(x)dx$ . Using this formula as a definition in the case of non-differentiable functions, show that  $H'[\phi] = \phi(0)$ . ( $\delta[\phi] \doteq \phi(0)$  is known as the Dirac delta function.)

**Answer 1.** Write your answer here.

Question 2. Let x be an n-dimensional vector. Recall the softmax function :  $S: \mathbf{x} \in \mathbb{R}^n \mapsto S(\mathbf{x}) \in \mathbb{R}^n$  such that  $S(\mathbf{x})_i = \frac{e^{\mathbf{x}_i}}{\sum_j e^{\mathbf{x}_j}}$ ; the diagonal function :  $\operatorname{diag}(\mathbf{x})_{ij} = \mathbf{x}_i$  if i = j and  $\operatorname{diag}(\mathbf{x})_{ij} = 0$  if  $i \neq j$ ; and the Kronecker delta function :  $\delta_{ij} = 1$  if i = j and  $\delta_{ij} = 0$  if  $i \neq j$ .

- 1. Show that the derivative of the softmax function is  $\frac{dS(\boldsymbol{x})_i}{d\boldsymbol{x}_j} = S(\boldsymbol{x})_i (\delta_{ij} S(\boldsymbol{x})_j)$ .
- 2. Express the Jacobian matrix  $\frac{\partial S(x)}{\partial x}$  using matrix-vector notation. Use diag(·).
- 3. Compute the Jacobian of the sigmoid function  $\sigma(x) = 1/(1 + e^{-x})$ .
- 4. Let  $\boldsymbol{y}$  and  $\boldsymbol{x}$  be n-dimensional vectors related by  $\boldsymbol{y} = f(\boldsymbol{x})$ , L be an unspecified differentiable loss function. According to the chain rule of calculus,  $\nabla_{\boldsymbol{x}} L = (\frac{\partial \boldsymbol{y}}{\partial \boldsymbol{x}})^{\top} \nabla_{\boldsymbol{y}} L$ , which takes up  $\mathcal{O}(n^2)$  computational time in general. Show that if  $f(\boldsymbol{x}) = \sigma(\boldsymbol{x})$  or  $f(\boldsymbol{x}) = S(\boldsymbol{x})$ , the above matrix-vector multiplication can be simplified to a  $\mathcal{O}(n)$  operation.

Answer 2. Write your answer here.

Question 3. Recall the definition of the softmax function :  $S(x)_i = e^{x_i} / \sum_j e^{x_j}$ .

1. Show that softmax is translation-invariant, that is: S(x+c) = S(x), where c is a scalar constant.

Multilayer Perceptrons and Convolutional Neural networks

- 2. Show that softmax is not invariant under scalar multiplication. Let  $S_c(\mathbf{x}) = S(c\mathbf{x})$  where  $c \geq 0$ . What are the effects of taking c to be 0 and arbitrarily large?
- 3. Let  $\boldsymbol{x}$  be a 2-dimentional vector. One can represent a 2-class categorical probability using softmax  $S(\boldsymbol{x})$ . Show that  $S(\boldsymbol{x})$  can be reparameterized using sigmoid function, i.e.  $S(\boldsymbol{x}) = [\sigma(z), 1 \sigma(z)]^{\top}$  where z is a scalar function of  $\boldsymbol{x}$ .
- 4. Let  $\boldsymbol{x}$  be a K-dimentional vector ( $K \geq 2$ ). Show that  $S(\boldsymbol{x})$  can be represented using K-1 parameters, i.e.  $S(\boldsymbol{x}) = S([0, y_1, y_2, ..., y_{K-1}]^{\top})$  where  $y_i$  is a scalar function of  $\boldsymbol{x}$  for  $i \in \{1, ..., K-1\}$ .

**Answer 3.** Write your answer here.

Question 4. Consider a 2-layer neural network  $y: \mathbb{R}^D \to \mathbb{R}^K$  of the form :

$$y(x,\Theta,\sigma)_k = \sum_{i=1}^{M} \omega_{kj}^{(2)} \sigma \left( \sum_{i=1}^{D} \omega_{ji}^{(1)} x_i + \omega_{j0}^{(1)} \right) + \omega_{k0}^{(2)}$$

for  $1 \leq k \leq K$ , with parameters  $\Theta = (\omega^{(1)}, \omega^{(2)})$  and logistic sigmoid activation function  $\sigma$ . Show that there exists an equivalent network of the same form, with parameters  $\Theta' = (\tilde{\omega}^{(1)}, \tilde{\omega}^{(2)})$  and tanh activation function, such that  $y(x, \Theta', \tanh) = y(x, \Theta, \sigma)$  for all  $x \in \mathbb{R}^D$ , and express  $\Theta'$  as a function of  $\Theta$ .

**Answer 4.** Write your answer here.

Question 5. Given  $N \in \mathbb{Z}^+$ , we want to show that for any  $f : \mathbb{R}^n \to \mathbb{R}^m$  and any sample set  $S \subset \mathbb{R}^n$  of size N, there is a set of parameters for a two-layer network such that the output y(x) matches f(x) for all  $x \in S$ . That is, we want to interpolate f with y on any finite set of samples S.

- 1. Write the generic form of the function  $y: \mathbb{R}^n \to \mathbb{R}^m$  defined by a 2-layer network with N-1 hidden units, with linear output and activation function  $\phi$ , in terms of its weights and biases  $(\boldsymbol{W}^{(1)}, \boldsymbol{b}^{(1)})$  and  $(\boldsymbol{W}^{(2)}, \boldsymbol{b}^{(2)})$ .
- 2. In what follows, we will restrict  $\mathbf{W}^{(1)}$  to be  $\mathbf{W}^{(1)} = [\mathbf{w}, \cdots, \mathbf{w}]^T$  for some  $\mathbf{w} \in \mathbb{R}^n$  (so the rows of  $\mathbf{W}^{(1)}$  are all the same). Show that the interpolation problem on the sample set  $\mathcal{S} = \{\mathbf{x}^{(1)}, \cdots \mathbf{x}^{(N)}\} \subset \mathbb{R}^n$  can be reduced to solving a matrix equation :  $\mathbf{M}\tilde{\mathbf{W}}^{(2)} = \mathbf{F}$ , where  $\tilde{\mathbf{W}}^{(2)}$  and  $\mathbf{F}$  are both  $N \times m$ , given by

$$\tilde{\boldsymbol{W}}^{(2)} = [\boldsymbol{W}^{(2)}, \boldsymbol{b}^{(2)}]^{\top}$$
  $\boldsymbol{F} = [f(\boldsymbol{x}^{(1)}), \cdots, f(\boldsymbol{x}^{(N)})]^{\top}$ 

Express the  $N \times N$  matrix  $\boldsymbol{M}$  in terms of  $\boldsymbol{w}, \boldsymbol{b}^{(1)}, \phi$  and  $\boldsymbol{x}^{(i)}$ .

- \*3. Proof with Relu activation. Assume  $\boldsymbol{x}^{(i)}$  are all distinct. Choose  $\boldsymbol{w}$  such that  $\boldsymbol{w}^{\top}\boldsymbol{x}^{(i)}$  are also all distinct (Try to prove the existence of such a  $\boldsymbol{w}$ , although this is not required for the assignment See Assignment 0). Set  $\boldsymbol{b}_{j}^{(1)} = -\boldsymbol{w}^{\top}\boldsymbol{x}^{(j)} + \epsilon$ , where  $\epsilon > 0$ . Find a value of  $\epsilon$  such that  $\boldsymbol{M}$  is triangular with non-zero diagonal elements. Conclude. (Hint: assume an ordering of  $\boldsymbol{w}^{\top}\boldsymbol{x}^{(i)}$ .)
- \*4. **Proof with sigmoid-like activations**. Assume  $\phi$  is continuous, bounded,  $\phi(-\infty) = 0$  and  $\phi(0) > 0$ . Decompose  $\boldsymbol{w}$  as  $\boldsymbol{w} = \lambda \boldsymbol{u}$ . Set  $\boldsymbol{b}_j^{(1)} = -\lambda \boldsymbol{u}^{\top} \boldsymbol{x}^{(j)}$ . Fixing  $\boldsymbol{u}$ , show that  $\lim_{\lambda \to +\infty} \boldsymbol{M}$  is triangular with non-zero diagonal elements. Conclude. (Note that doing so preserves the distinctness of  $\boldsymbol{w}^{\top} \boldsymbol{x}^{(i)}$ .)

**Answer 5.** Write your answer here.

IFT6135-H2019 Prof : Aaron Courville

**Question 6.** Compute the *full*, *valid*, and *same* convolution (with kernel flipping) for the following 1D matrices: [1, 2, 3, 4] \* [1, 0, 2]

**Answer 6.** Write your answer here.

Question 7. Consider a convolutional neural network. Assume the input is a colorful image of size  $256 \times 256$  in the RGB representation. The first layer convolves  $64.8 \times 8$  kernels with the input, using a stride of 2 and no padding. The second layer downsamples the output of the first layer with a  $5 \times 5$  non-overlapping max pooling. The third layer convolves  $128.4 \times 4$  kernels with a stride of 1 and a zero-padding of size 1 on each border.

- 1. What is the dimensionality (scalar) of the output of the last layer?
- 2. Not including the biases, how many parameters are needed for the last layer?

**Answer 7.** Write your answer here.

**Question 8.** Assume we are given data of size  $3 \times 64 \times 64$ . In what follows, provide the correct configuration of a convolutional neural network layer that satisfies the specified assumption. Answer with the window size of kernel (k), stride (s), padding (p), and dilation (d), with convention d = 0 for no dilation). Use square windows only (e.g. same k for both width and height).

- 1. The output shape of the first layer is (64, 32, 32).
  - (a) Assume k = 8 without dilation.
  - (b) Assume d = 6, and s = 2.
- 2. The output shape of the second layer is (64, 8, 8). Assume p = 0 and d = 0.
  - (a) Specify k and s for pooling with non-overlapping window.
  - (b) What is output shape if k = 8 and s = 4 instead?
- 3. The output shape of the last layer is (128, 4, 4).
  - (a) Assume we are not using padding or dilation.
  - (b) Assume d = 1, p = 2.
  - (c) Assume p = 1, d = 0.

**Answer 8.** Write your answer here.
